METEORA ALPHA FACTORY

Causally validated DLMM liquidity research, execution calibration and hedging on Solana

EXACTNESS	FRESH-FORWARD	FUTURE-INPUT VIOLATIONS	LIVE CAPITAL
7 / 8	12 / 12	0	NO

What we are building. An independent research system for testing whether actively managed Meteora DLMM liquidity creates value from fees and disciplined recentering after accounting for causal timing, execution costs, SOL directional risk and capital scale.

Proof of work. Frozen A/B policies; fee-accounting validation; +300s live alignment rejected after observed revisions; +600s alignment frozen and independently validated over 12 fresh hours with 12/12 decision parity, 12/12 post-witness OHLC stability and zero future-input violations.

Shadow snapshot - descriptive only

17 Sep 2026, $1,000 reference: challenger +3.63%, control +3.29%, fixed 50/50 HODL -1.58%, challenger max drawdown -2.83%. Short sample; not a forecast; realized execution exactness still pending.

Remaining research: realized execution calibration -> dynamic SOL hedge -> capacity ladder -> post-freeze historical replay.

Public-good grant ask: $5,000 for data, infrastructure, engineering, reproducible tooling and public research outputs.

Separate research-sponsor ask: $1,500 for the ring-fenced realized-execution experiment and direct experiment costs. No return is promised.

PUBLIC OUTPUT

Causal evidence framework, execution calibration methodology, hedge accounting, capacity simulator, historical replay report and public documentation.

WHY SOLANA / METEORA

The research depends on Solana account/transaction state and Meteora DLMM bin mechanics; candle-only backtests cannot answer the same questions faithfully.
